

AVAYA INFINITY SOLUTIONS BRIEF: SC INTERVIEW GUIDE

A Technical Deep-Dive into the Architecture, Security, and Business Value of the MCP Prototype

1. Purpose & Application Context

This Solutions Brief serves as a technical walkthrough designed to present during solutions consulting and sales engineering interview cycles. The accompanying console application was created to bridge the gap between abstract database standards—such as the Model Context Protocol (MCP)—and the tangible, high-level business case metrics that C-suite stakeholders prioritize (\$ TCO savings, deployment speed, and HIPAA SLA protection).

By presenting this application, the candidate demonstrates an understanding of Avaya's actual Infinity roadmap: including AI-agnostic models integration (BYOAI), zero-copy Lakehouses, human-in-the-loop priority routing safeguards (Tandem Care), and strict zero-trust audit compliance checked by Databricks Unity Catalog.

2. Financial Value: Legacy Spaghetti vs. Avaya Infinity

The Architecture Playground tab in the application models the direct business impact of simplifying integration pipelines from legacy custom-coded connectors (\$N \times M\$ paths) to the standardized Model Context Protocol (\$N + M\$ bus):

Metric	Legacy Point-to-Point Connectors	Avaya Infinity MCP Bus Architecture
Annual TCO	\$150,000 / year in developer maintenance	\$15,000 / year (90% maintenance cost savings)
Deployment Speed	4 Months per enterprise data repository	2 Hours plug-and-play client-server setup
Security Policy Scope	High Risk (Static files, scattered API tokens)	Protected (Centralized zero-trust API gateway)
Integration Bus	N x M bespoke integration wrappers	N + M unified schemas exposed to models

3. Databricks Unity Catalog Enterprise Governance

Avaya Infinity enforces zero-trust security parameters directly through the gateway database layer:

- **Dynamic HIPAA Masking:** The proxy layer intercepts customer records (like Jeff Edwards) and replaces them with redacted formats (J*** E*****) in payloads, SQL INSERT events, and chat windows.
- **Centralized RBAC Rules:** Unauthorized database queries are blocked at the gateway level, returning 403 Security Exceptions, preventing data leakage.
- **Active Compliance Dashboard:** Running counters monitor PII items masked, request blocks, and SLA compliance health in real-time.

4. Presets & Simulated Business Outcomes

Scenario Preset	Aura AI Tool Action	Quantified Outcome & ROI
Queue Recovery Spike	Queries active schedules via Postgres & Zendesk CRM; blocks training conflicts; reroutes chat loads.	Wait times cut from 185s to 15s. Prevented \$3,200/day in SLA penalties.
VIP Priority Routing	Scans SIP trunks via ACM server; identifies voice quality failures; prompts Tandem Care auth checkpoint.	Escalated VIP calls to L3 in 10s. Retained \$24,000 VIP account contract ARR .
Retention Discount Policy	Queries SharePoint policy documents; applies SOP-Finance-204 coupons; inserts updated records.	Authorized \$1,260 retention credit, saving \$8,400 contract value (6.6x ROI relative to CAC).
