

AVAYA INFINITY MCP SOLUTIONS BRIEF

Standardizing AI Connections & Centralizing Databricks Governance

1. Executive Summary

Avaya Infinity's Model Context Protocol (MCP) framework shifts enterprise communication systems from traditional static point-to-point connections to dynamic AI-driven connection orchestration. Historically, custom pipelines required massive coding efforts to connect models directly to backend databases, inflating maintenance budgets and raising security exposure concerns. By introducing a centralized MCP gateway, Avaya enables unified data discovery, real-time query parsing, and seamless multi-AI model support, reducing implementation costs by up to 90% and integration times from months to hours.

2. Financial Comparison & TCO Metrics

For sales leadership (Carlos) and sales engineers (SEs), the value proposition is represented by the reduction in connection complexity from an $N \times M$ custom mess to a standard $N + M$ open bus:

Metric	Legacy Spaghetti Architecture	Avaya Infinity MCP Bus
Annual TCO	\$150,000 / year (Custom code maintenance)	\$15,000 / year (90% savings)
Deployment Agility	4 Months per connector	2 Hours plug-and-play
Security/Compliance	High Risk (Static files, exposed credentials)	Protected (Zero-Trust isolation)
Integration Logic	$N \times M$ point-to-point scripting	$N + M$ unified schema gateway

3. Databricks Unity Catalog Enterprise Governance

Avaya Infinity wraps all database queries through Databricks Unity Catalog to enforce zero-trust security:

- **Dynamic HIPAA Redaction:** Customer profiles are automatically masked inside tool arguments, database inserts, and chat responses. Customer names are replaced with formatted redacted masks.
- **Role-Based Access Control (RBAC):** If unauthorized database calls are attempted (e.g. settings restricted), the query fails immediately with a secure 403 Exception.
- **Unified Compliance Audit Logging:** Access blocks, credential updates, and masking triggers are dynamically pushed into centralized audit logs.

4. Simulated Scenarios & Business Outcomes

Scenario	AI Action	Business Outcome
Queue Recovery Spike	Identifies break schedules, blocks concurrent webinar meetings, redirects chat traffic.	Wait time cut from 185s to 15s. Prevented \$3,200/day in SLA penalties.
VIP Priority Routing	Triggers voice trunk jitter troubleshooting and Tandem Care supervisor escalation checkpoints.	Escalated to L3 in 10s. Retained \$24,000 VIP contract ARR ; 100% CSAT.
Retention Discount ROI	Searches SharePoint contract policy, computes retention discount guidelines, files records.	Applied \$1,260 credit, saving \$8,400 contract value (6.6x ROI relative to CAC).
